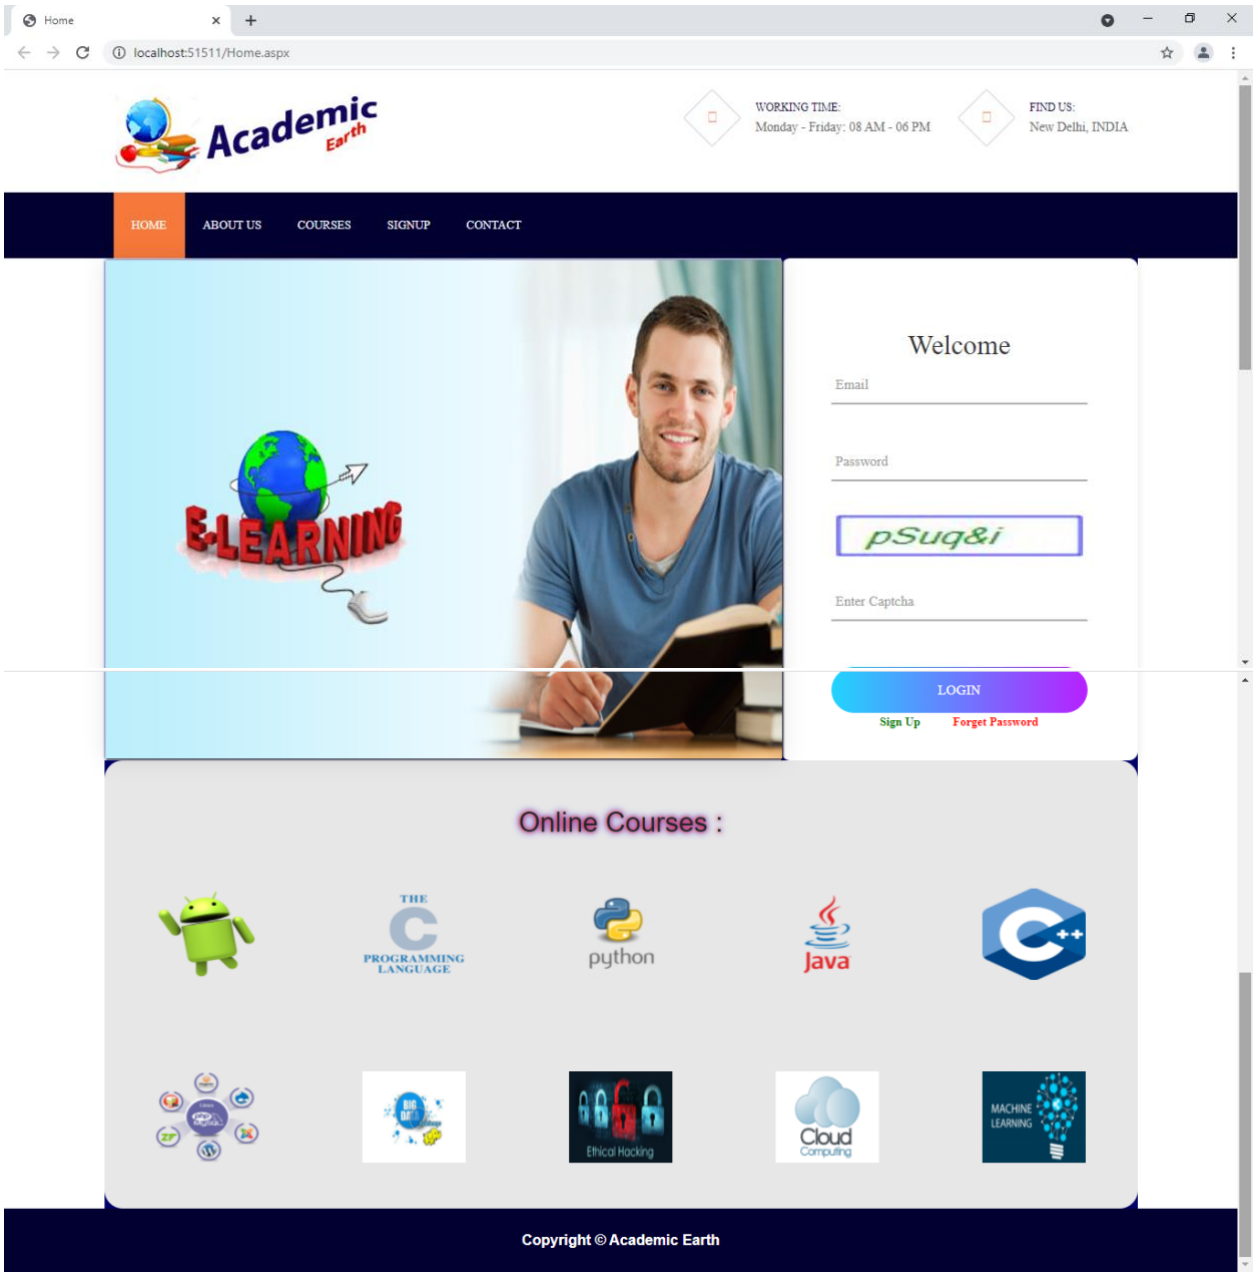
PROJECT REPORT

PROJECT TITLE

ONLINE EDUCATION SYSTEM



PROJECT INTRODUCTION

Online education is a form of education where students use their computers, mobiles and tablets through the internet. Online education has become popular in the past decade. Online education is electronically supported learning that relies on the internet for teacher and student interaction and the distribution of class materials. Online education can include audio, videos, text, animation, virtual training environment and live chats with teachers. It can be engaging, fun and tailored to fit almost anyone's schedule. All live videos are kept in recorded form after class. Online education has become a viable and exciting method for instructional delivery in the global business society that runs on a 24/7 schedule (24 hours a day/7 days a week) because it provides students with great flexibility.

Online education offers many positive benefits since students:

- have flexibility in taking classes and working at their own pace and time
- learn to become responsible for their own education with information available at their fingertips
- find the submission of assignments easy and convenient
- are more apt to voice their own opinions and share and debate issues with other students, as well as learn from other students during the group discussions

Possible negative effects of learning online are that some students:

- may miss the face-to-face interaction with the instructor and among students
- may prefer to attend traditional classes with an instructor who teaches and guides them through the course

PROJECT OBJECTIVE

The internet has become an essential part of our daily life, and many teacher came online and teach students. Now a days every work is going to computerized, manpower is used with computer system to increase the efficiency and reliability of the work. it also provides a lot of time to do that work with friendliness.

The primary aim of this project is to demonstrate that with the better interactive features with students and teachers. The objective of this project is to provide freely online smart class anywhere and anytime. Every School and college can access it easily.

The objectives of the project are as follows:

- Enhance the quality of learning and teaching.
- Meet the learning style of needs of students.
- Improve the efficiency and effectiveness.
- Improve user-accessibility and time flexibility to engage learners in the learning process.
- Doubts session or test paper regularly discuss.
- Learn from anywhere or anytime.
- Save travel time and cost.

SOFTWARE REQUIREMENT SPECIFICATION

The System Requirement Specification provides the software designer with a representation of information, function and behavior that can be translated to architectural, interface and component-level designs. The Requirement specification specified the software operational characteristics; indicates software‟s interface with other system elements; and establish constraints that software must meet.
In the development of project the following requirements specifications of Organization are considered:

User Requirements:

It deals with the working of the Administrator or Operator of the Web Site Application. Basically it is a document having the details of all the constraints. In this Project, The users have to login according to their authentic User ID and Password; the any other activities can‟t be performed without Authorization.

It must include:

- An user must be an authorize one
- Different level of user has limited access
- Duplication of User Id & Password is not allowed

System Requirements:

It is a detailed description of the user requirements. It served on the basis of their contracts for the implementation of the system; therefore it is the complete and consistent specification of the whole system. It specifies the user requirements.

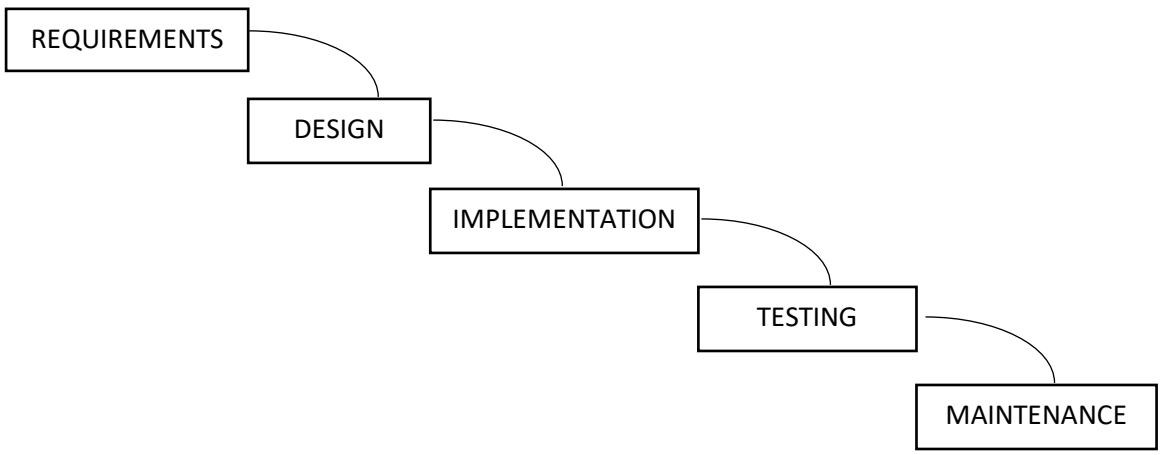
In this System the basic user requirements are:

- Have a complete good services and Monitoring System
- Analytical reports can be generated according to their requirements.
- One time entry should be used to generate the respective reports.

MODEL ADOPTED

In IEEE glossary software engineering is defined as the application of systematic, disciplined, quantifiable approach to the development, operation and maintenance of software, that is, the application of engineering to software. In the last few decades, the computer industry has undergone revolutionary changes in hardware to maintain the compatibility with hardware, the complexity of software has also changed. Software engineering provides models that lead to the production of well documented software in a manner that is predictable. For a mature process, it should be possible to determine in advance how much time and effort will be required to produce the final product. To develop successful software following model has been considered, which act as guideline.

The model I have used is Waterfall Model or Classic Life Cycle Model is also the simplest and oldest, and most widely used process model. Unlike Build and Fix Model which has two phases in first phase code is developed and in another code is fixed in this model, each phase of the life cycle is completed before the startup of new phase. This is the first engineering approach of software development. Then customer requirements are taken in consideration then planning, modeling, construction and finally deployment.



SOFTWARE BACKGROUND

Windows 10:

Windows 10 is a series of operating system developed by Microsoft. It is successor to windows 8.1. Microsoft released Windows 10 in July 2015. The company has said it will update Windows 10 continuously, rather than release a new, full-fledged operating system as a successor.

Windows 10 system requirements:

The minimum Windows 10 hardware requirements for a PC or 2-in-1 device are:

- Processor: 1 gigahertz (GHz) or faster processor or system-on-a-chip (SoC)
- RAM: 1 gigabyte (GB) for 32-bit or 2 GB for 64-bit
- Hard disk space: 16 GB for 32-bit OS 20 GB for 64-bit OS
- Graphics card: DirectX 9 or later with Windows Display Driver Model 1.0
- Display: 800x600

SECURITY:

Windows 10 includes Windows Security, which provides the latest antivirus protection. The device will be actively protected from the moment of start Windows 10. Windows Security continually scans for malware, viruses, and security threats. In addition to this real-time protection, updates are downloaded automatically to help keep your device safe and protect it from threats.

ASP .NET:

ASP .NET 2.0 is an HTML-embedded scripting language. Much of its syntax is borrowed from C, JAVA and Perl with a couple of unique ASP .NET 2.0. The goal of the language is to allow web developers to write dynamically generated pages quickly. This is generally a good definition of ASP .NET 2.0. However, it does contain a lot of terms you may not be used to. When someone visits your ASP .NET 2.0 webpage, your web server processes the ASP .NET 2.0 code. It then sees which parts it needs to show to visitors and hides the other stuff (file operations, math calculations, etc.) then translates your ASP .NET 2.0 into HTML. After the translation into HTML, it sends the webpage to your visitor's web browser.

ASP .NET 2.0 will allow you to:

- Reduce the time to create large websites.
- Create customized user experience for visitors based on information that you have gathered from them.
- Open up thousands of possibilities for online tools. Check out ASP .NET 2.0 – Hot Scripts for examples of the great things that are possible with ASP .NET 2.0.
- Allow creation of shopping carts for e-commerce websites.

SQL SERVER:

A database is a collection of information that is organised so that it can be easily accessed, managed and updated. Using Microsoft SQL server, we can manage all our information from a single database file. Within the file, divide our data into separate storage containers called table, view and update table data using offline forms, and retrieve just the data we want using quires and analyse or print the data in a specific layout using report.

- To store our data create one table for each type of information we track. To bring the from multiple tables together a query, form or report, we define the relationship between the table.
- To find the retrieve just the data that meets conditions we specify, including data from multiple tables, create a query. A query can also update or delete single records at one time, and perform built-in or custom calculations on our data.
- To analyse our data or present it a certain way it print, create a reports.

JAVA SCRIPTS:

JavaScript is a programming language commonly used in web development. It was originally developed by Netscape as a means to add dynamic and interactive elements to websites. While JavaScript is influenced by Java, the syntax is more similar to C and is based on ECMAScript, a scripting language developed by Sun Microsystems.
JavaScript is a client-side scripting language, which means the source code is processed by the client's web browser rather than on the web server. This means
JavaScript functions can run after a webpage has loaded without communicating with the server. For example, a JavaScript function may check a web form before it is submitted to make sure all the required fields have been filled out. The JavaScript code can produce an error message before any information is actually transmitted to the server. JavaScript functions can be called within <script> tags or when specific events take place.

PROBLEM ANALYSIS

Software requirement Analysis and specification:

During our analysis of the project, we referred various books and manuals and conduct questionnaire with various administrators. The job of system administrator involves the maintain the new entry broker who are wanted to do testing, getting detail knowledge of the testing on videos, videos quality, comment section. This task is usually entrusted to a single person, the system administrator, also known as the super user. He has vest powers, having access to practically everything.

System planning:

Scheduling of a software project does not differ greatly from System administrator in windows 10 is not quite demanding and requires form the administrator in a depth knowledge of the different components. The above stated task of a system administration is considered as routine duties of an administrator. But system problem can be quite grave and unexpected by identify the system responsibilities of an administrator to be quite demanding requiring a knowledge of the system. We identified a need of "graphical tool for the task of system administration as its menu and screens will guide him through the whole process.

Project Estimation:

The project size is another important factor for the project estimation that can affect accuracy and efficacy of estimations. As size increase, the interdependency among various elements of the software grown rapidly.

Risk Analysis:

Risk analysis and management are a series of steps that help a software team to understand and manage uncertainty. Many problems can affects a software project. A risk is a potential problem-it might happen it might not.

- Natural risk: Natural threats may be caused by natural disaster like fire, storm, earthquake, floods etc.
- Deliberative act risk: Threats may come from fraud, broker etc.
- Unintended risk: There may be some unavoidable threats like computer bug, traffic load on server.

SYSTEM DESIGN

System design is a detail study of various operations performed by a system and its relationship with in end outside the system. A system is a collection of interrelated components that work together to achieve common objective and system analysis is the specification of what the system required.ERD (Entity relationship diagram) and DFD(Data Flow Diagram)are the tools which are used for designing.

DFD (DATA FLOW DIAGRAM):

The data flow diagram is a graphical representation of the flow of data through an information system. Data flow diagram is also used for utilisation of data processing. Data flow daigram is initial step to create an overview of the system without going into great details. It is divided into many parts 0 level,1st level and 2nd level etc.

ER Diagram (ENTITY RELATIONSHIP DIAGRAM):

Entity relationship diagram is a graphical representation of an information system that shows relationship between people, object, place, concepts or events within that system. There is a relation between two attributes: the relation is either one to many, many to one and many to many.

ENTITY RELATIONSHIP DIAGRAM

IMPLEMENTATION

The module data is stored in the database. It can be access only by the user who is having excess permission. Access control module also give security to all the website modules. Security refers to the protection of data against unauthorised access, alteration. Security measures to the propsed system at different levels. It provides high security, a client can modify only permitted areas. Primary key validation is used in this project. Password protection is provided and otp provided at the web or application level.

TESTING

Software testing is the process of evaluation a software item to deduct differences between we need input and aspect output. Testing access quality of product. Software testing is the process that should be done during the developing process in other word software testing is verification and validation process.

White-Box Testing: It is also called glass box testing. It is a test case design method that uses the control structure of the procedural design to derive test cases. In this all statement in the program has been executed at least once during testing that all logical conditions have been exercised. Using white box testing methods, software engineer can derive test cases that

- Guarantee that all independent paths within a module have been exercised at least once.
- Exercise all loops at their boundaries and within their operational bounds.
- Exercise all logical decision on their true and false sides.
- Exercise internal data structure to assure their validity.

Black Box Testing: It focuses on the functional requirements of the software i.e. black box testing enables the software engineer to derive sets of input condition that will fully exercise all functional requirements for a program. Black box Testing is not alternative to white box testing. Rather, it is a complementary approach that is likely to uncover different class errors than white box testing.

Black box Testing attempts to find errors in the following categories:

- Incorrect or missing function.
- Interface error.
- Errors in the data structure or external database.

- Performance error.
- Initialization and termination errors.

.

SYSTEM ANALYSIS

Feasibility study:

Feasibility is define as the practical extend to which a project can be perform successfully. To evaluate feasibility, feasibility study is performed which determines whether the solution considered to complete the requirement is practical and workable in the software. The objective of feasibility study is to establish the reason for developing the software that is expectable to users, confrontable to establish standard. The another objective of feasibility study is to determine, whether the software can be implement using the current technology and within the specified budget and schedule.

Technical feasibility:

It access current resource and technology. Which are required to complete. User requirements in the software within the allocated time and budget. It determines whether the relevant technology is stable and establish.

Advantages of language are achieved as:

- Good interface for user.
- Allow changes as when required.
- It is rapid action development tool, which makes processing fast.
- Coding make technical processing easy.

Economic feasibility:

It determines whether the required software is capable of generating financial gain for the organisation.it involve the cost incurred on the software development team and

cost of hardware and software. Software is said to be economically feasible if it focus on the below points cost incurred on software development to produce long term gain for organisation cost required to conduct full software investigation cost of hardware software development team and training.

DETAILED HARDWARE AND SOFTWARE

Hardware specification of machine used

Central processing unit	Intel core3i
Random access memory	4GB
Hard disk drive	500GB
Keyboard	102 key
Mouse	Windows Compatible

Software (O.S. Language, Packages) used along version

Operating system	Windows 10
Front end	ASP.NET
Back end	SQL server
Package	MS-Word

SECURITY

Computer is a versatile instruction with almost enormous capacity computation at an unimaginable speed. The end user is concerned about security along with increased dependence on the computer. In system development, the project manager must consider measures for marinating data and controlling secret at all time. The level of protection depends on the sensitivity of the data, the reliability of the user, & the complexity of the system. A well designed system includes control procedure to provide physical protection (hardware security) and restrict system access (database security).

Application security:

In our project, going password an application security. In our project, if the user type wrong password and user name then he/she cannot enter inside the project, if the users want to users want to use or run the project then he/she must enter the correct user name and password. If the user type three times wrong password and click three times enter then our project will close and he/she not enter any type.

Database security:

The database security is most essential to avoid theft or leakage of confidential data. A control must be kept over the issue of data file, so that possibilities of destruction are minimized. Any person not open database. If he/she know password then he/she open database. The security arrangement should be provided by computer installation initially at time it is being established rather then being added later on. Security is like sheet belt it does not guarantee there will be not accident. However, when accident does occur it may be found too much cheaper, it may records. The system security problem can be divided into following related issues.

LIMITATIONS

Our system is also having limitations:

- There is no automatically facility of saving to main database.
- Any from which will directly close may loss database information.
- There is no facility of direct access.
- There is no automatically edit the records.

• Documentation:

It is time consuming and requires expertise in creating good documentation from view point of top administrators users.

• Manuals:

Various manuals are to be prepared such as user manuals, System manuals etc. It needs time, human labor and are subject to change drastically as the technology changes.

• Online Help:

One needs to provide online help to various users so that all the features of the software can be properly understood by the user.

• Complexity:

It is time consuming to manage and debug all the modules one by one.

CONCLUSION

Online education is a growing and exciting new way to learn about almost anything. If there is a course you have always wanted to take or a skill you have always wanted to learn, but you have not had the time to attend a traditional face-to-face class or there hasn't been an opportunity near you, then online learning might be your answer.

Today's online learning opportunities offer everything from one-hour live workshops to online degrees. There is virtually something for everyone, all you have to do is find it.

However, learning online is different from learning in a face-to-face setting, and it is important to think about your goals, your needs and your interests before committing yourself to something. You also need to think about the time you have available, your comfort level with using technology and the equipment that is at your disposal. As we all become more familiar with computers and computer access becomes increasingly common, online learning will continue to open doors and offer learning opportunities for those who are interested.
